| 16. Abstract (Limit: 200 words)<br>The National Roadway Traffic Noise Exposure Model (NRTNEM) is comprised of a collection of on-line datasets, some containing programs and others containing data. This manual describes the NRTNEM system as it existed on the NCC (EPA's National Computer Center) in December 1981, under user ID EPADYN.<br><br>NRTNEM actually consists of two models: The General Adverse Response Model ("GAR"), and the Single Event Model ("SEM"). Only one of them can be executed by a job at a time. The User's Manual describes job submission procedures. This manual describes the NRTNEM system in more detail so as to facilitate program maintenance. This manual is organized from two points of view: present first those items the user first comes into contact with, and go from the general to the specific. Accordingly, the general properties of files and datasets are described first, and the coding details are last. |                                     |   |  |

## FOREWORD

The reader should be familiar with the NRTNEM User's Manual and is assumed to be a fairly experienced FORTRAN programmer familiar with IBM's TSO (Time Sharing Option for models 360/370) and the WYLBUR conversational system. In addition, he should have a working knowledge of procedures and conventions at EPA's National Computer Center (NCC). In particular, he should have the following publications available:

- National Computer Center - IBM System,  
"NCC - IBM WYLBUR Guide"
- U.S. Environmental Protection Agency,  
"NCC - IBM User's Guide"
- IBM, "OS/VSE TSO Command Language Reference,"  
GC28-0646-4.
- IBM, "OS/VSE TSO Terminal User's Guide,"  
GC28-0645-4.
- IBM, "IBM System/360 and System/370 FORTRAN  
IV Language," GC28-6515-10.
- Ashbrook, J.D. and Sande, G., "A User's  
Guide to the Integrated Plotting Package,"  
National Institute of Health, U.S. Department  
of Health, Education and Welfare, March  
1975.
- IBM, "OS/VSE MVS Job Control Language,"  
GC28-0692-4.

The National Roadway Traffic Noise Exposure Model is described in the form in which it existed in NCC files on August, 1981.

## 1. INTRODUCTION

The National Roadway Traffic Noise Exposure Model (NRTNEM) exists in the computer as a collection of on-line datasets, some containing programs and others containing data. A full list of these datasets is provided in Table 1-1. This is the minimum required. As a user works with NRTNEM, he will undoubtedly establish other datasets which are derived from this minimum collection. This manual describes the system as it existed in NCC (EPA's National Computer Center) on August, 1981, in user id EPADYN.

NRTNEM actually consists of two models: The General Adverse Response Model ("GAR"), and the Single Event Model ("SEM"). Only one of them can be executed by a job at a time. The User's Manual describes job submission procedures. This manual describes the NRTNEM system in more detail so as to facilitate program maintenance. This manual is organized from two points of view: present first those items the user first comes into contact with, and go from the general to the specific. Accordingly, the general properties of files and datasets are described first, and the coding details are last.

Table 1-1  
NRTNEM Computer Files

| Fully Qualified Dataset Name                | Characteristics |                  |        |        |               |                       |            | Description  |
|---|-----------------|------------------|--------|--------|---------------|-----------------------|------------|--|
|   | (1)             | WYLIBUR Format   | Volume | Tracks | Record Format | Logical Record Length | Block Size |  |
| CN.EPADYN.S2KC.TRAWO                        | P               | CARD             | USER75 | 190    | FB            | 80                    | 3120       | FORTRAN source code for GAR and SEM. Each source module constitutes a member of TRAWO.   |
| CN.EPADYN.S2KC.BUILD                        | P               | (not applicable) | USER68 | 190    | FB            | 80                    | 80         | Object module library. Each object module constitutes a member of BUILD.   |
| CN.EPADYN.S2KC.FRRXC                        | S               | CARD             | USER75 | 1      | FB            | 80                    | 3120       | Contains JCL (including a PROC) for compiling members of TRAWO and storing them into BUILD.  |
| CN.EPADYN.S2KC.RNHEXE9R                     | S               | TSO              | USER65 | 1      | FB            | 80                    | 3120       | Contains JCL and some input data for running either GAR or SEM. This dataset is edited by \$RNHSUF.  |
| CN.EPADYN.S2KC.\$RNHSUF.CLIST               | S               | (not accessible) | USER67 | 1      | V0            | 255                   | 4240       | TSO command procedure file executed by the user in the TSO conversational environment. Edits RNHEXE9R and submits result as a job to be run. |
| CN.EPADYN.S2KC.WYLIB(FIHP)                  | H               | EDIT             | USER69 | 267    | FB            | 80                    | 3120       | Contains fractional impact information for SEM only.   |
| CN.EPADYN.S2KC.WYLIB(FLOMIX08)              | H               | EDIT             |        |        |               |                       |            | Contains traffic flow and mix data.  |
| CN.EPADYN.S2KC.WYLIB(MILE)                  | H               | EDIT             |        |        |               |                       |            | Contains highway mileages.   |
| CN.EPADYN.S2KC.WYLIB(PERCNT)                | H               | EDIT             |        |        |               |                       |            | Contains Traffic Percentages by vehicle type.  |

S = Sequential Dataset  
H = Member of a Partitioned Dataset

(2) EPAxxx = user's identification  
aaaa = user's account  
yyyyyy = user-assigned name for vehicle growth data  
zzzzzz = user-assigned name for regulation instructions

## 2. SUPPORT SYSTEM

Files RNMXE9R and \$RNMSUF.CLIST are considered the support system. RNMXE9R contains Job Control Language (JCL) statements and data for running both the GAR and SEM. \$RNMSUF.CLIST is a TSO command file (invoked by the EXEC command in TSO) which edits RNMXE9R according to user interaction while \$RNMSUF.CLIST is executing and thus produces a stream of lines which is automatically submitted as a batch job. During this editing, lines not needed for one or the other model are deleted, character strings are modified, and symbols (preceded by a # sign in RNMXE9R) are replaced by values to be used in this job.

Figure 2-1 shows RNMXE9R. The following discusses it line by line. RNMXE9R is also explained in Appendix B of the User's Manual so that the following text concentrates on programming aspects leaving out details available in the User's Manual. Figure 2-2 shows \$RNMSUF.CLIST; its execution's effects on RNMXE9R are described together with that file starting on page 2-7.

Figure 2-2 (Concluded)

| Line or<br>Line Range<br>in RNMEXE9R | Explanation   | Effect by<br>\$RNMSUF.CLIST   |
|--------------------------------------|---|---|
| 9000-9001                            | JOB statement   | symbols (strings preceded by #) are replaced with actual values   |
| 9020                                 | Output routing specification  |   |
| 9954-9995                            | Linkedit job step   |   |
| 9970                                 | Dataset BUILD is the library of object modules.   |   |
| 9975                                 |   | for SEM, #MAINP is replaced by SEMAIN9R and #BKD becomes BKDSEM8S; for GAR #MAINP becomes VARNET9R and #BKD becomes BLKDTA. |
| 9985-9995                            | Names of object modules needed during link editing.                                       |   |
| 9985                                 |   | none for GAR; for SEM SERESC becomes SERESCSE.  |
| 9986-9889                            |   | deleted for SEM   |
| 9991-9994                            |   | deleted for GAR   |
| 10000-18200                          | Job step that executes NRTNEM.  |   |
| 10000                                |   | supply REGION parameter depending on SEM or GAR   |
| 10020                                | Use the load module generated in the previous step; don't keep it after end of this step. |   |
| 12500                                |   | #REGSCN1 is replaced by the user's vehicle growth file name   |
| 12700                                | FORTRAN unit 6 is the unit for printed output   |   |
| 12800                                | Unit 1 is a temporary file to receive data to be plotted                                  |   |
| 12930                                |   | #FILU2 is replaced by the user's regulation instruction file name.  |
| 12940                                | Unit 8 contains the noise level dictionary  |   |
| 13000-13150                          | From unit 3, the program reads mostly constant data                                       | for GAR, FILMP is replaced by SIGMA0  |
| 13200-18200                          | Unit 4 data is read right from the input stream   |   |

| Line or<br>Line Range<br>in RNMXE9R | Explanation   | Effect by<br>\$RNMSUF.CLIST   |
|-------------------------------------|---|---|
| 13300-13840                         | Control strings (see User's Guide)                        | May be edited directly by the user. The user must edit at least the IVMASK control string for SEM runs. |
| 13820-13840                         | Strings as shown in Figure 2-1 are defaults for GAR       | Establishes default strings for SEM   |
| 13900-14210                         | Vehicle breakdown ratios (see Appendix D of User's Guide) | deleted for GAR   |
| 14300                               | Number of net years                                       | Change 09 to actual number of net years (computed in lines 12900-13000, implemented in 14300).          |
| 14400                               | A default string of net years                             | Replace with actual net years (read in line 12800, implemented in 14400)                                |
| 14722-14756                         | RATIO data for SEM  | deleted for GAR   |
| 14800-18200                         | Text for Title Page                                       | if GAR, change appropriately  |
| 15600                               |   | Symbols (preceded by #) are replaced by actual strings  |
| 16600-16850                         |   |   |
| 17300-18100                         | Space for insertion of comments by the user               | User may edit comments into these lines during Steps S3 or S8.  |
| 18310-18430                         | Linkedit job step for plotting                            |   |
| 18370                               | The Integrated Plotting Package is used                   |   |
| 18380                               | BUILD also contains some plotting modules                 |   |
| 18410                               |   | deleted for SEM   |
| 18415                               |   | deleted for GAR   |
| 18440-18490                         | Generation of neutral plotting file                       |   |
| 18450                               | &PPTAPE is neutral plotting file                          |   |
| 18470                               | &PLINF contains data to be plotted (see line 12800)       |   |
| 18500-18540                         | Creation of printer plots from neutral plotting file      |   |

### 3. HOW TO MODIFY THE FORTRAN SOURCE CODE

A listing of all the source modules is provided in Appendix C. They are written in FORTRAN for IBM's FORTRAN H Extended Compiler. Each module (main program or subroutine) is sorted as a separate member of the partitioned dataset CN.EPADYN.S2KC.TRAWO (see Table 1-1 for a listing of datasets). When making modifications, the programmer goes through the following steps:

1. Edit the source module in WYLBUR, save the edited version in TRAWO. The same operation may replace an existing module or create a new one.
2. Modify the job and output routing statements in lines 1 and 2 of file CN.EPASRD.MUSN.FORT2 as appropriate\*.
3. Change the member name of BUILD and TRAWO in lines 9 and 10 of FORT2 to the name of the edited or new source module.

Figure 3-1 shows a listing of file CN.EPASRD.MUSN.FORT2. It is used for submitting jobs for compiling source modules in TRAWO and saving the resulting object modules in BUILD.

\*File CN.EPADYN.S2KC.FRRXC was originally used to modify or create an object module. However, this file is not operable since the program IFEAAB does not exist in STEPLIB FTHXLINK at NCC.

```
//EPASRD JCB (MUSN,COTM),COTMAN,PRTY=5
/*ROUTE PRINT RMT171
/*
//*  @FORT          FORTRAN G1 COMPILE AND SAVE OBJECT MODULE
//*  DEFAULT PARAMETERS OF PROC FTG1C:
//*    CREGION=246K,PRINT=A,PUNCH=DUMMY,CPARM=
/*
//STEPFORT EXEC FTG1C,CREGION=500K,CPARM='MAP, ID'
//SYS PUNCH DD DSN=CN.EPADYN.S2KC.BUILD(DEGFAC1),DISP=(OLD,KEEP)
//SYSIN DD DSN=CN.EPADYN.S2KC.TRAWO(DEGFAC1),DISP=SHR
//COMP FORT EXEC PGM=IEBCOPY,PARM='COMPRESS'
//SYS PRT DD SYSOUT=A
//SYSUT1 DD DISP=OLD,DSN=CN.EPADYN.S2KC.TRAWO
//SYSUT2 DD DISP=OLD,DSN=CN.EPADYN.S2KC.TRAWO
//SYSUT3 DD UNIT=SYSDA,SPACE=(TRK,(1))
//SYSUT4 DD UNIT=SYSDA,SPACE=(TRK,(1))
//SYSIN DD DUMMY
//CCNPOBJ EXEC PGM=IEBCOPY,PARM='COMPRESS'
//SYS PRT DD SYSOUT=A
//SYSUT1 DD DISP=OLD,DSN=CN.EPADYN.S2KC.BUILD
//SYSUT2 DD DISP=OLD,DSN=CN.EPADYN.S2KC.BUILD
//SYSUT3 DD UNIT=SYSDA,SPACE=(TRK,(1))
//SYSUT4 DD UNIT=SYSDA,SPACE=(TRK,(1))
//SYSIN DD DUMMY
```

Figure 3-1. Listing of File CN.EPASRD.MUSN.FORT2

#### 4. DATA STORED EXTERNALLY TO THE PROGRAM MODULES

NRTNEM reads several data files in the course of its execution (see also Table 1-1):

##### A. Files with invariant names:

1. CN.EPADYN.S2KC.NLDICT: Noise level dictionary
2. CN.EPADYN.S2KC.WYLIB(MILE): Roadway mileages
3. CN.EPADYN.S2KC.WYLIB(PERCNT): Traffic percentages
4. CN.EPADYN.S2KC.WYLIB(FIMP): Fractional impact (SEM only)
5. CN.EPADYN.S2KC.WYLIB(SIGMAO): Noise level standard deviations (GAR only)
6. CN.EPADYN.S2KC.WYLIB(FLOMIX08): Flow mix

##### B. Files with user-assigned names:

7. CN.EPAXXX.aaa.WYLIB(yyyyyy): xxx = user id, aaaa = account code, yyyyyy = name of WYLIB member containing vehicle growth and population data.
8. CN.EPAXXX.aaa.zzzzz: Dataset containing regulation instructions.

Note that the block data subprograms (module BLKDAT for GAR, module BLKDTSEM for SEM) contain other data which are discussed in Section 5. Those of the above eight files which are not discussed in the User's Guide are explained in detail later in this section. Files 1 (NLDICT), 7 (VGFS001), and 8 (RIF) are discussed in the User's Guide. The vehicle population portion of file 7 is discussed in this section.

#### 4.1 Roadway Mileages

Figure 4-1 shows the contents of the WYLIB member CN.EPADYN.S2KC.WYLIB(MILE). As can be seen, data is provided in NAMELIST format for an array called MILE. It is dimensioned as follows:

MILE (6, 9, 4, 5)

where there are six roadway types, nine place sizes, four population density categories, and five speed ranges. One thousand and eighty (1080) data items are therefore provided, arranged six to a line in 180 lines. Each provides the mileage for a particular collection of pieces of roads as described by the meanings of the array's indices.

| 1.  | KMWAY2 | MILE= | 0,    | 5,    | 10,    | 41,    | 37,     | 94, |
|-----|--------|-------|-------|-------|--------|--------|---------|-----|
| 2.  |        | 0,    | 7,    | 21,   | 71,    | 71,    | 172,    |     |
| 3.  |        | 0,    | 1,    | 4,    | 11,    | 12,    | 31,     |     |
| 4.  |        | 0,    | 5,    | 17,   | 45,    | 42,    | 119,    |     |
| 5.  |        | 0,    | 5,    | 24,   | 58,    | 61,    | 149,    |     |
| 6.  |        | 0,    | 5,    | 29,   | 67,    | 69,    | 171,    |     |

Figure 4-1 (Concluded)

#### 4.2 Operating Mode Percentages

Figure 4-2 shows the contents of WYLIB member CN.EPADYN.S2KC.WYLIB(PERCNT). The data indicate the percent of time vehicles spend in various operating modes as a function of roadway type. Since there are four operating modes, six roadway types, and 14 vehicle types, one would expect 336 data items. However, the data differ only for two roadway type groups (group 1 includes types 1, 2, 3; group 2 includes 4, 5, 6) and for four vehicle type groups (group 1: vehicle types 1 through 7, and 13 and 14; group 2: vehicle types 8, 9, 10; group 3: vehicle type 11; group 4: vehicle type 12) (see array IPER in BLOCK DATA). Therefore, only 4\*2\*4 numbers are required for filling array PERCNT which is dimensioned:

PERCNT (4, 2, 4)

where the first index refers to operating mode, the second to roadway type group, and the last to vehicle type group.

1. PERCNT= 0.0470,0.0536,0.8588,0.0106,0.1540,0.1600,0.5510,0.1350,  
2. 0.0500,0.0500,0.8500,0.0500,0.1300,0.1700,0.5500,0.1400,

Figure 4-2. Contents of CN.EPADYN.S2KC.WYLIB(PERCNT)

#### 4.3 Fractional Impact Data

Figure 4-3 shows the contents of WYLIB member CN.EPADYN.S2KC.WYLIB(FIMP). The data indicate the fractional impact factors for the SEM. Array FIMP is filled which is dimensioned:

FIMP (80, 5)

where 80 reserves space for 80 factors corresponding to noise levels spaced 1 dB apart; the 5 reserves spaces for five different fractional impact functions:

- 1 -- Sleep disruption
- 2 -- Sleep awakening
- 3 -- Indoor Speech Interference
- 4 -- Outdoor and Pedestrian Speech Interference
- 5 -- All fractional impact factors are set to 1 which results in a simple "population exposed" count

Figure 4-3. Contents of CN.EPADYN.S2KC.WYLIB(FIMP)

#### 4.4 Noise Level Standard Deviations

Figure 4-4 shows the contents of WYLIB member CN.EPADYN.S2KC.WYLIB(SIGMA0). The user may supply the standard deviations of the vehicle noise levels if he runs the GAR. The data may be present if SEM is run, but is not used. The basic noise levels are supplied through the noise level dictionary file NLDICT and the user's regulation instruction file. Denoting a noise level standard deviation by SIG, a basic noise level LEQ is modified according to:

$$LEQ = LEQ + 0.05 \ln(10) * SIG^{*2}$$

(see DO-Loop in module TRAW0(VARNET9R) ending at label 4101).

It is recommended that this feature of the program not be used for the following reason:

- o SEM and GAR use the same noise level dictionary file, but only GAR can accept noise level standard deviation data. Running GAR with nonzero standard deviation data therefore would lead to using different noise levels in the two models.

The noise level standard deviations should therefore always be set to zero as shown in Figure 4-4.

1. SIG=1400\*0,E0,

Figure 4-4. Contents of CN.EPADYN.S2KC.WYLIB(SIGMA0)

#### 4.5 Flow Mix

Figure 4-5 shows the contents of WYLIB member CN.EPADYN.S2KC.WYL1B(FLOMIX08). The data contain the percentage vehicle mix in traffic flow by place size and roadway type. Since there are 14 vehicle types, nine place size categories, and six roadway types, one might expect 756 data items. However, the data are assumed to differ only for four place size groups (group 1: place size categories 1-3; group 2: 4-6; group 3: 7-8; group 4: 9) and five roadway groups (group 1: roadway types 1 and 2; group 2: 3; group 3: 4; group 4: 5; group 5: 6). The data fill array FLOMIX which is dimensioned:

FLOMIX (14, 4, 5)

where the first index refers to vehicle type, the second to place size group, and the last to roadway group.

Figure 4-5. Contents of CN.EPADYN.S2KC.WYLIB(FLOMIX08)

#### 4.6 Distribution of Vehicle Population by Type

This is also referred to as "Vehicle Breakdown" and is described in detail in Appendix D of the User's Guide.

#### 4.7 Vehicle Population and Age Data

Appendix C of the User's Guide describes the Vehicle Growth File, a portion of which contains vehicle population and age data. Array REMO (Figure C-1 of the User's Guide) contains the vehicle population data as it existed in 1974, broken down by model year, for six vehicle type groups (group 1: light vehicles (types 1 through 7); group 2: trucks (types 8 and 9); group 3: intercity buses (10); group 4: transit buses (11); group 5: school buses (12); group 5: motorcycles (types 13 and 14)). Array MYREF contains six years which indicate the model years with which the corresponding population data in REMO begins. Thus, the second number in the second line of REMO (59871.) is the population of trucks of model year 1959 as they existed in 1974. Note that the populations for the earliest model years (first line of REMO) also include all vehicles older than that model year.

The REMO data in the master vehicle growth file CN.EPADYN.S2KC.WYLIB (VGFS001) is identical to the data in BLOCK DATA. Thus, it is superfluous. However, if updated information should become available, it will not be necessary to change BLOCK DATA, but only this input data since it supercedes the data in BLOCK DATA.

## 5. DATA STORED INTERNALLY TO THE PROGRAM MODULES

### 5.1 The GAR BLOCK DATA Subprogram

GAR's BLOCK DATA module, TRAWO(BLKDTA), contains data and verbal definitions (see Appendix C) for the GAR constants listed alphabetically below.

|        |        |        |
|--------|--------|--------|
| A      | GAMM   | NAT    |
| ADBA   | IEQAGE | NHT    |

## 6. THE SOURCE CODE

### 6.1 Introduction

The source code of all routines is written in FORTRAN, occasionally taking advantage of nonstandard features offered by IBM's FORTRAN H Extended Compiler. The code is stored by module: each module contains one routine (main program or subroutine, no matter what the size) and is stored as a member of the partitioned dataset TRAWO (see Table 1-1). Section 3 explains the mechanics of how to make changes to the modules.

Section 6.2 gives an overview of the models through the use of flowcharts and subroutine linkage tables.

In Section 6.3 we refer to the source listings in Appendix C where we first provide a listing of all source modules in the sequence given in Figure 3-1. Note that the listings for each module first show the cross-references and then the source code itself in an edited format provided by the compiler (except BLOCK DATA routines). The source code contains numerous comments which the reader should consider an integral part of this manual.

Section 6.4 gives symbol dictionaries for the GAR and SEM.

### 6.2 Flowcharts and Subroutine Linkages

#### 6.2.1 The General Adverse Response Model

Figure 6-1 shows a flowchart of the GAR stressing the overall logic flow through the program, but including most subroutine calls for easy reference by programming personnel. Table 6-1 lists the modules in alphabetical order and indicates their purpose; also listed are the source module's member names in TRAWO which are sometimes different from the FORTRAN global symbol under which a module is known to the linkage editor. Note that the object module member names for dataset BUILD equal those in TRAWO.

Table 6-2 gives a cross-reference of subroutine calls.

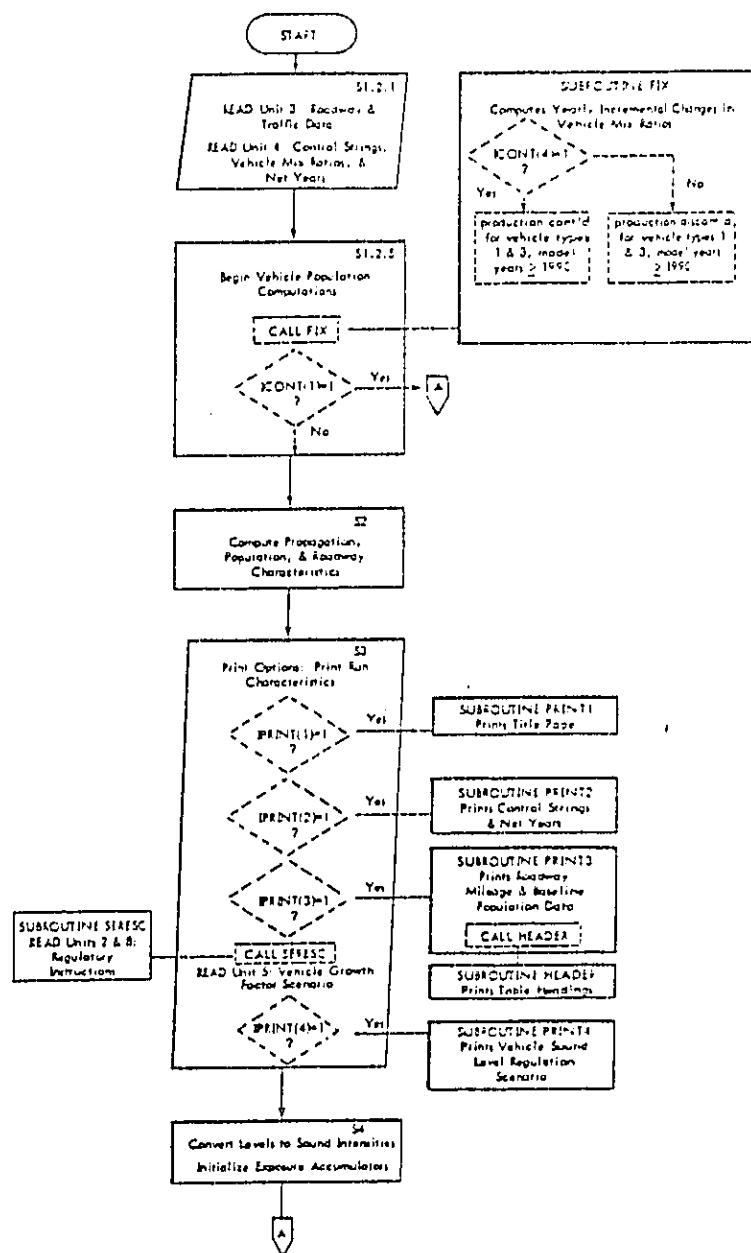

Figure 6-1. Flowchart for GAR

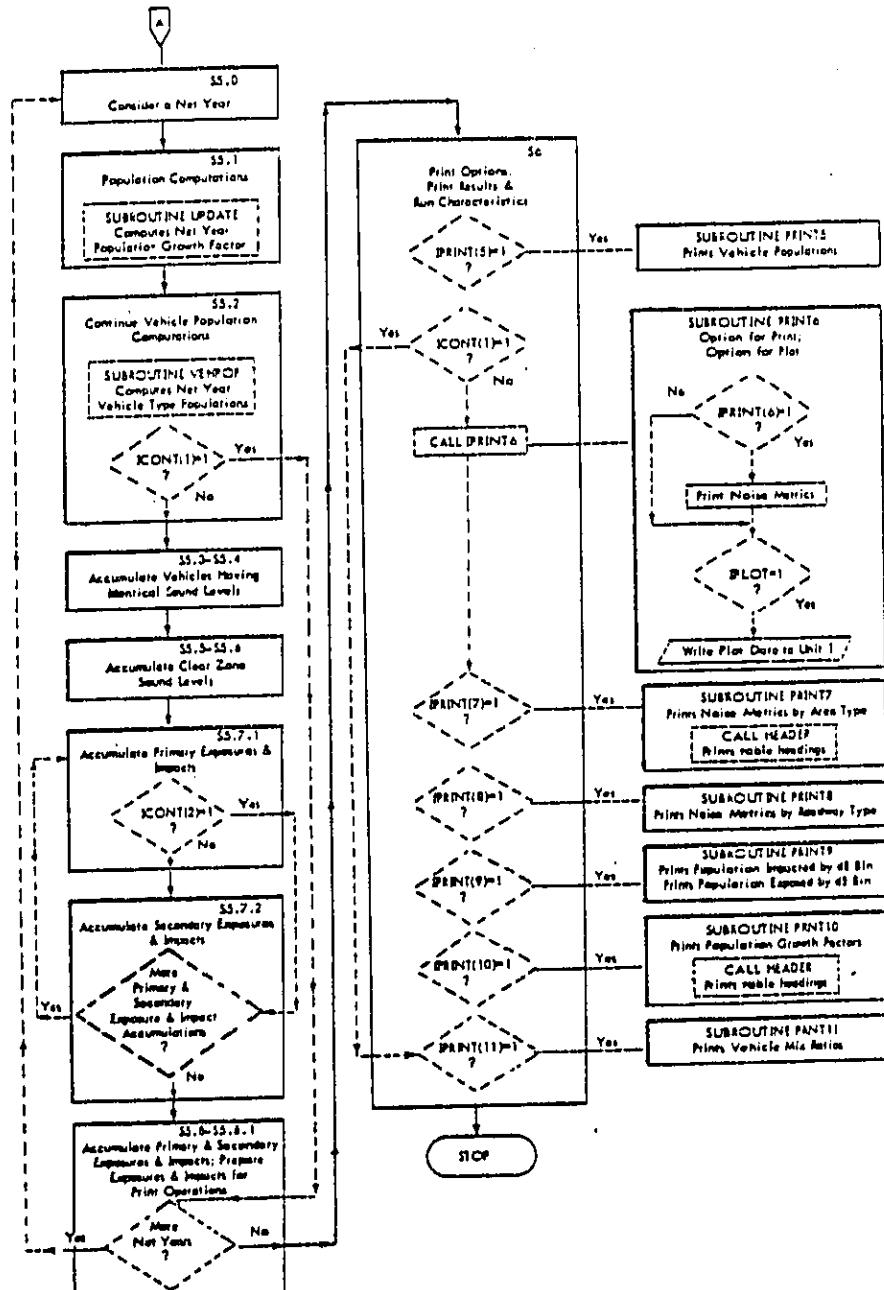

Figure 6-1 (Concluded)

Table 6-1  
List of GAR Modules

FS = Function subprogram  
Sub = Subroutine

| Module Name         | Member Name in TRAWO | Module Type | Purpose   |
|---------------------|----------------------|-------------|---|
| ADD(AL1,AL2)        | ADD                  | FS          | adds two sound levels   |
| BLOCK DATA          | BLKDTA               | block data  | contains compiled data  |
| CONST(GAM)          | CONST                | FS          | assigns attenuation factor dependent constants  |
| DBLEV(X)            | DBLEV                | FS          | returns "DBLEV" at "X", given "X"; reads Wyle curve, inverse to "RAD(AL)"                 |
| FACTOR(GAM,DR,DFCL) | FACTOR               | Sub         | assigns and combines attenuation factor dependent constants                               |
| FIX                 | FIX                  | Sub         | computes the new array YINC to fix function "VBD"   |
| HEADER              | HEADER               | Sub         | prints a common heading for all population tables (in PRINT3, PRINT7, & PRNT10)           |
| IYBAS(MDUM)         | IYBAS                | FS          | converts standard notation year, to year with respect to baseline (in VEHPOP(IYRN))       |
| IYES(IYR)           | IYES                 | FS          | converts year with respect to reference, to year with respect to "MYRE" (in VEHPOP(IYRN)) |
| IYREF(MDUM)         | IYREF                | FS          | converts standard year to year measured with respect to reference year (in VEHPOP(IYRN))  |
| MAIN                | VARNET9R             | Main        | calculates the number of people impacted by noise originating from highway traffic        |
| PRINT1              | PRINT1               | Sub         | prints title page for each run  |
| PRINT2              | PRINT2               | Sub         | prints user opted control strings   |
| PRINT3              | PRINT3               | Sub         | prints constant data by area type "J"   |
| PRINT4              | PRINT4               | Sub         | prints the regulation scenario  |
| PRINT5              | PRINT5               | Sub         | prints vehicle population   |
| PRINT6(IPLOT)       | PRT6V9R              | Sub         | prints primary impact metrics   |

Table 6-1 (Continued)

| Module Name     | Member Name<br>in TRAW0 | Module<br>Type | Purpose  |
|-----------------|-------------------------|----------------|--|
| PRINT7          | PRINT7                  | Sub            | prints population impacted, by area type   |
| PRINT8          | PRINT8                  | Sub            | prints population impacted, by roadway type  |
| PRINT9(ICASE)   | PRINT9                  | Sub            | prints impact and exposure in 5 dB intervals   |
| PRNT10          | PRNT10                  | Sub            | prints population growth factors by area type  |
| PRNT11          | PRNT11                  | Sub            | prints vehicle breakdown factor for each year from 1957 through 2013   |
| RAD(AL)         | RAD                     | FS             | gives distance at which given level "AL" occurs, given "AL0"; it is an inverse Wyle curve reader   |
| SERESC          | SERESC                  | Sub            | defines the vehicle noise levels using a noise level dictionary file on unit 8 and accepting regulatory selection instructions from unit 2 |
| UPDATE(MYRC)    | UPDATE                  | Sub            | updates population growth factor each year   |
| VBD             | VBD                     | FS             | computes current vehicle breakdown (in PRNT11 & VEHPOP(IYRN))  |
| VEHPOP(IYRN)    | VEHPOP                  | Sub            | computes vehicle population from "REMO", growth, and attrition factors   |
| XMINUS(AL1,AL2) | XMINUS                  | FS             | takes the difference between two sound levels  |

List of SEM Modules

FS = Function Subprogram  
SUB = Subroutine

| Module Name              | Member Name<br>in TRAWO | Module<br>Type | Purpose   |
|--------------------------|-------------------------|----------------|---|
| COLECT(POPINC,IE,KDB)    | COLECT                  | SUB            | Accumulates impacts   |
| DBBAND(1BEG,ARRAY,TITLE) | DBBAND                  | SUB            | Prints noise metrics by dB bin  |
| EVENTS                   | EVENTS                  | SUB            | Computes the event bins in which noise impacts may occur                |
| EVNTDB(1BEG,TITLE,1IM)   | EVNTDB                  | SUB            | Prints noise metrics by dB & event bins                                 |
| FIX                      | FIXSEM                  | SUB            | Computes the new array YINC to fix function "VBD"                       |
| HEADER(1SUB)             | HEADRSEM                | SUB            | Prints table headings   |
| HEADG(1CASE)             | HEADG                   | SUB            | Prints table headings   |
| HEADV                    | HEADV                   | SUB            | Prints table headings   |
| IYBAS(MDVM)              | IYBASSEM                | FS             | Converts standard notation year, to year with respect to baseline       |
| IYES(IYR)                | IYESSEM                 | FS             | Converts year with respect to reference, to year with respect to "MYRE" |
| IYREF(MDVM)              | IYREFSEM                | FS             | Converts standard year, to year with respect to reference year          |
| MAIN                     | SEMAIN9R                | MAIN           | Reads, computes & prints data to be exercised by SUBROUTINE TIMSTR      |
| NORMAL(1M)               | NORMAL                  | SUB            | Prepares impact data for printed tabulation                             |
| PRINT1                   | PRT1SEM                 | SUB            | Prints title page for each run  |
| PRINT2                   | PRT2SEM                 | SUB            | Prints control strings & net years                                      |

Table 6-3 (Continued)

| Module Name        | Member Name<br>in TRAW0 | Module<br>Type | Purpose  |
|--------------------|-------------------------|----------------|--|
| PRINT3             | PRT3SEM                 | SUB            | Prints roadway milage & base-line population data  |
| PRINT4(ICS)        | PRT4SEM                 | SUB            | Prints vehicle sound level regulation scenario   |
| PRINT5             | PRT5SEM                 | SUB            | Prints vehicle population  |
| PRNT10             | PRT10SEM                | SUB            | Prints population growth factors by area type  |
| PRNT11             | PRT11SEM                | SUB            | Prints vehicle breakdown factor for each year from 1957 through 2013   |
| SERESC(KRET)       | SERESCSE                | SUB            | Defines the vehicle noise levels using a noise level dictionary file on unit 8 and accepting regulatory selection instructions from unit 2 |
| TABLE(ARRAY,TITLE) | TABLE                   | SUB            | Prints noise metrics by day, night & total   |
| TIMSTR             | TIMSTR8S                | SUB            | Computes seven metrics of noise originating from roadway traffic   |
| UPDATE(YEAR)       | UPDATSEM                | SUB            | Updates population growth factor each year in a piecewise linear fashion as a function of place size                                       |
| VBD()              | VBDSEM                  | FS             | Computes current vehicle mix ratio   |
| VEHPOP(IYRN)       | VEPOPSEM                | SUB            | Computes vehicle population from "REMO", growth and attrition factors  |
| ZERO(R,N)          | ZERO                    | SUB            | Initializes real arrays to zero  |
| ZEROI(I,N)         | ZEROI                   | SUB            | Initializes integer arrays to zero   |

F = Function Subprogram

S = Subroutine

\*Note: Subroutine DUMPER is not referenced in this version.

### 6.3 Source Code Listings

The NRTNEM Version 9R source code as of September 29, 1980, appears in Appendix C. Due to its bulk, it was impractical to include it into the main text of this manual.

### 6.4 Symbol Dictionaries

The GAR Symbol Dictionary starts on the next page, the one for SEM start on page 6-27.

#### 6.4.1 GAR Symbol Dictionary

\*\*\*\*\*  
\* SYMBOL DICTIONARY FOR THE GENERAL ADVERSE RESPONSE MODEL OF THE NATIONAL ROADWAY TRAFFIC NOISE EXPOSURE MODEL \*  
\*\*\*\*\*

\*\*\*\*\*  
\* VERSION 9R  
\*\*\*\*\*

KEY:

ENTRIES ARE OF THE GENERAL FORM: NAME, INDICES, NATURE, COMMON BLOCK OR SUBROUTINE, AND DESCRIPTION.

"NAME" OCCUPIES THE FIRST COLUMN.

"INDICES" OCCUPY COLUMN 2 AND GIVE THE INDICES OF ARRAY VARIABLES.

COLUMN 3 CONTAINS THE NATURE AND IS A CODED DESCRIPTION OF THE NATURE OF THE VARIABLE. THE CODE BEFORE THE COLON INDICATES WHETHER THE NAME IS A CONSTANT (C) OR A VARIABLE (V). THE CODE AFTER THE COLON TELLS WHAT KIND OF VARIABLE OR CONSTANT IT IS. THE OPTIONS ARE:

FOR CONSTANTS:

C COMPILED CONSTANTS. INITIALIZED IN DATA STATEMENTS.

D DERIVED CONSTANTS. THEY ARE COMPUTED ONCE IN THE PROGRAM AND NOT CHANGED AFTER THAT.

I3,4,5 INPUT CONSTANTS WHICH ARE READ IN. NUMERAL INDICATES THE INPUT FILE NUMBER.

S SELECTOR ARRAYS.

FOR VARIABLES:

A ACCUMULATORS INTO WHICH QUANTITIES ARE ACCUMULATED.

D DUMMY VARIABLES.

C COUNTER VARIABLES: KEEP TRACK OF ORDER OF TABLES PRINTED.

I VARIABLES WHICH INTERNAL TO A SUBROUTINE.

S      STORAGE VARIABLES FOR VARIOUS COMPUTED METRICS.  
 T      TEMPORARY VARIABLES FOR PASSING NUMBERS ALONG TO SUBROUTINES IN COMMON AREAS OR FOR LEGIBILITY OF CODE.  
 X      INDEX VARIABLES. THEIR RANGE IS GIVEN BY THE EXPRESSION R(X;Y) AT THE BEGINNING OF THE DESCRIPTION.  
 PA     INTERMEDIATE ACCUMULATOR FROM WHICH A METRIC IS LATER DERIVED.  
 THE RANGE OF AN INDEX IS GIVEN IN THE FORM R(X;Y) OR R(Y) AT THE BEGINNING OF THE DESCRIPTION. X IS THE LOWER LIMIT AND Y THE  
 UPPER LIMIT. WHEN X IS NOT EXPLICITLY GIVEN, IT IS 1.  
 "COMMON BLOCK OR SUBROUTINE" GIVES EITHER THE NAME OF THE COMMON BLOCK WITHIN WHICH THE SYMBOL APPEARS OR THE  
 SUBROUTINE (OR MAIN PROGRAM) GLOBAL NAME WHERE IT IS USED IF IT IS NOT IN A COMMON BLOCK.  
 THE "DESCRIPTION" IS A SHORT, ONE-LINE EXPLANATION OF THE MEANING OF THE VARIABLE.  
 THE ENTRIES FOLLOW AND ARE IN ALPHABETICAL ORDER.

|              |               | COMMON BLOCK<br>OR SUBROUTINE |   |   |

6.4.2 SEM Symbol Dictionary

\*\*\*\*\*  
\* SYMBOL DICTIONARY FOR THE SINGLE EVENT MODEL OF THE NATIONAL ROADWAY TRAFFIC NOISE EXPOSURE MODEL \*  
\*  
\* VERSION 9R  
\*\*\*\*\*

KEY:

ENTRIES ARE OF THE GENERAL FORM: NAME, INDICES, NATURE, COLUMN BLOCK OR SUBROUTINE, AND DESCRIPTION.

"NAME" OCCUPIES THE FIRST COLUMN.

"INDICES" OCCUPY COLUMN 2 AND GIVE THE INDICES OF ARRAY VARIABLES.

COLUMN 3 CONTAINS THE NATURE AND IS A CODED DESCRIPTION OF THE NATURE OF THE VARIABLE. THE CODE BEFORE THE COLON INDICATES WHETHER THE NAME IS A CONSTANT (C) OR A VARIABLE (V). THE CODE AFTER THE COLON TELLS WHAT KIND OF VARIABLE OR CONSTANT IT IS. THE OPTIONS ARE:

FOR CONSTANTS:

- C COMPILED CONSTANTS. INITIALIZED IN DATA STATEMENTS.
- D DERIVED CONSTANTS. THEY ARE COMPUTED ONCE IN THE PROGRAM AND NOT CHANGED AFTER THAT.
- I3,4,5 INPUT CONSTANTS WHICH ARE READ IN. NUMBER INDICATES THE INPUT FILE NUMBER.
- S SELECTOR ARRAYS.

FOR VARIABLES:

- A ACCUMULATORS INTO WHICH QUANTITIES ARE ACCUMULATED.
- D DUMMY VARIABLES.
- C COUNTER VARIABLES: KEEP TRACK OF ORDINAL OF TABLES PRINTED.
- I VARIABLES WHOLLY INTERNAL TO A SUBROUTINE.

S      STORAGE VARIABLES FOR VARIOUS COMPUTED METRICS.  
 T      TEMPORARY VARIABLES FOR PASSING NUMBERS ALONG TO SUBROUTINES IN COMMON AREAS OR FOR LEGIBILITY OF CODE.  
 X      INDEX VARIABLES. THEIR RANGE IS GIVEN BY THE EXPRESSION R(X:Y) AT THE BEGINNING OF THE DESCRIPTION.  
 PA     INTERMEDIATE ACCUMULATOR FROM WHICH A METRIC IS LATER DERIVED.

THE RANGE OF AN INDEX IS GIVEN IN THE FORM R(X:Y) OR R(Y) AT THE BEGINNING OF THE DESCRIPTION. X IS THE LOWER LIMIT AND Y THE UPPER LIMIT. WHEN X IS NOT EXPLICITLY GIVEN, IT IS 1.

"COMMON BLOCK OR SUBROUTINE" GIVES EITHER THE NAME OF THE COMMON BLOCK WITHIN WHICH THE SYMBOL APPEARS OR THE SUBROUTINE (OR MAIN PROGRAM) GLOBAL NAME WHERE IT IS USED IF IT IS NOT IN A COMMON BLOCK.

THE "DESCRIPTION" IS A SHORT, ONE-LINE EXPLANATION OF THE MEANING OF THE VARIABLE.

THE ENTRIES FOLLOW AND ARE IN ALPHABETICAL ORDER.

| SYMBOL RANGE         |        | COMMON BLOCK<br>OR SUBROUTINE |   | EXPLANATORY TEXT |
|----------------------|--------|-------------------------------|---|------------------|
|                      | NATURE | (GLOBAL SYMBOL)               |   |                  |

 DJKLEV (J,K,IL,KH) C:D BIG005 COMBINED AREA TYPE AND ROADWAY TYPE LEVEL CORRECTION (COMPUTED IN MAIN, DO LOOP 2110).  
       USED FOR CALCULATING AL0 TOGETHER WITH DLLEV IN TIMSTR, ACCORDING TO Eqs.(E-19) AND (E-20) OF APPENDIX E OF THE THEORETICAL BACKGROUND MANUAL, AS FOLLOWS:  
       THE MAIN PROGRAM CALCULATES (ARRAY SUBSCRIPTS DROPPED FOR CLARITY):

FOR SEL:  $DJKLEV = -10 \times \text{ALOG10}(X2) + 10 \times \text{GAMM} \times \text{ALOG10}(DRE/X2)$ ,

WHERE DRE = DISTANCE FROM LANE CENTER TO ROADWAY EDGE.

FOR LED:  $DJKLEV = -20 \times \text{ALOG10}(X2) + 10 \times \text{GAMM} \times \text{ALOG10}(DRE/X2)$

NOTE THAT THE FIRST EXCESS ATTENUATION COEFFICIENT  $G_{\text{AII}}(1)$  IDENTIFIED IN APPENDIX E IS ALWAYS ZERO SINCE THE SOUND IS ALWAYS EMITTED FROM A ROADWAY WHICH IS ALWAYS ASSUMED ACOUSTICALLY HARD. Eqs. (E-17B) AND (E-18B) FOR SOFT SURFACES ARE THEREFORE NEVER USED IN THE COMPUTER PROGRAM. THE MAIN PROGRAM CALCULATES FURTHER:

FOR SEL:  $DLEV = 10 \times \text{ALOG10}(2 \times \text{THETA} \times DREF \times 2 / (11/7.5 \times V))$

WHERE  $2 \times \text{THETA}$  IS THE RESULT OF THE INTEGRAL IN EQ. (E-18A), AND  $11/7.5 = 1.466$  IS THE CONVERSION FACTOR FROM MILES PER HOUR TO FEET PER SECOND.

FOR LED:  $DLEV = 10 \times \text{ALOG10}(2 \times \text{THETA} \times DREF \times 2 / 6)$

WHERE THE 6 STARS FROM EQ. (E-17A).

6-32

SUBROUTINE THSTR CALCULATES AL0 AS FOLLOWS:

$AL0 = ALREG + DLLEV + SHIFT.$

THIS EXPANDS TO:

FOR SEL:  $AL0 = ALREG + SHIFT + 10 \times \text{GAMMA} \times \text{ALOG10}(DRE/X2) + 10 \times \text{ALOG10}(2 \times \text{THETA} \times (X2/1.466 \times V)) \times (DREF/X2) \times 2,$

WHERE: ALREG IS THE NOISE LEVEL AT THE REFERENCE DISTANCE DREF,

SHIFT IS EXTERIOR SKIN BUILDING NOISE REDUCTION,

THE THIRD TERM REPRESENTS THE EXCESS ATTENUATION FROM THE ROAD EDGE TO THE CLEAR ZONE EDGE,

AND THE LAST TERM COMPRISSES THREE ITEMS:

$2\pi\theta = \text{INTEGRAL OF EQ. (E-18A)},$   
 $X_2/(1.466\sqrt{V}) = \text{THE } 10 \times \text{LOG}_{10}(D/V) \text{ TERM IN EQ. (E-19),}$   
 $(D_{REF}/X_2)^{1/2} = \text{SPREADING LOSS.}$

FOR LEO:  $A_{LO} = A_{LREG} + \text{SHIFT} + 10 \times \text{LOG}_{10}(D_{REF}/X_2)^{1/2} + 10 \times \text{LOG}_{10}(2\pi\theta/(6(X_2/V))) + (D_{REF}/X_2)^{1/2},$

WHERE  $6(X_2/V)=T$  FROM EQ. (E-17A).

| ROBEDC (ID,J,KS,IL,KH) | C:D  | BIG005 RELATIVE SOUND LEVEL AT THE EDGE OF THE POPULATED ZONE (ALO IS ADDED TO OBTAIN CUTOFF LEVEL). THE WAY THIS ARRAY IS COMPUTED BECOMES CLEAR WHEN USING FIG. 2-9 OF THE THEORETICAL BACKGROUND DOCUMENT WHICH |

SHOWS THE POINT SOURCE SOUND ATTENUATIONS IN POPULATED ZONES. LET A1 BE THE SLOPE OF THIS FUNCTION ABOVE THE KINK, AND A2 BELOW IT. TAKE AS AN EXAMPLE THE FIRST EQUATION FOR R0BEDG COMPUTED IN SECTION 24 OF THE MAIN PROGRAM AND WRITE IT IN MORE EXPLICIT FORM (SUBSCRIPTS DROPPED FOR CLARITY), AND ASSUME THAT WE ARE "BELOW" THE KINK:

$$R0BEDG = (10-A2) * \text{ALOG10}((X2+WDT HPZ)/X2) - (DBK - (DBK/A1)*A2)$$

R0BEDG IS THE SOUND ATTENUATION FROM THE EDGE OF THE CLEAR ZONE TO THE END OF THE POPULATED ZONE. THE FIRST TERM IS THE SIMPLE SPREADING LOSS. SINCE SEL PROPAGATES LIKE A LINE SOURCE, 10 IS ADDED TO THE SLOPE -A. LEU PROPAGATES LIKE A POINT SOURCE AND THEREFORE THERE IS NO 10 IN FRONT OF -A. THE SECOND TERM CORRECTS FOR THE PRESENCE OF THE KINK. THE SKETCH EXPLAINS THE EXPRESSION:

REDCF (ID,J,K,IL) C/D BIGO03 RATIO OF "EDGE" TO "X2"

Figure 6-3. Update To GAR Symbol Dictionary

## APPENDIX A

### Modifications of NRTNEM to Include Vehicle Breakdown Ratios for 1983 for Motorcycles

This appendix describes modifications to the National Roadway Traffic Noise Exposure Model to include vehicle breakdown ratios for the year 1983 for the two motorcycle vehicle types: "unmodified" and "modified," types 13 and 14, respectively. Both GAR and SEM were modified. These modifications were not incorporated in Version 9R of NRTNEM which is documented in the main body of this document.

Logic and coding modifications were required as shown in Table A-1.

Table A-1  
List of Modified Files

| Which Model          | Member Name in Version 9R    | Member Name after Modification     |
|----------------------|------------------------------|------------------------------------|
| GAR                  | FIX<br>VBD<br>PRNT11         | FIX83<br>VBD83<br>PRNT1183         |
| SEM                  | FIXSEM<br>VBDSEM<br>PRT11SEM | FIXSEM83<br>VBDSEM83<br>PRT11SEM83 |
| Support System Files |                              |                                    |
| both                 | RNMEXE9R<br>\$RNMSUF.CLIST   | WAYNEJCL.CNTL<br>CLSTWAYN.CLIST    |

Common Block BIG007 was added containing array VBD83 which is analogous in structure to VBD77 and VBD85, except that it pertains only to vehicle types 13 and 14.

Whereas VBD77 and VBD85 are read in the main program, VBD83 is read in subroutine FIX. The remainder of the logic parallels existing logic for VBD77 and VBD85.

Listings of the modified source code members of partitioned dataset TRAW0 are shown in Figures A-1 through A-6. Figures A-7 and A-8 show WAYNEJCL.CNTL and CLSTWAYN.CLIST. Note that the latter two were developed sometime before NRTNEM Version 9R (described in the main text of this manual) was frozen on September 29, 1980. In the latter two figures, the relevant sections are highlighted with double vertical parallel bars so that they could be used for editing later version files.

PRT11SEM and PRNT11 generate the vehicle breakdown tables for SEM and GAR, respectively. Examples of the superseded and superseding formats are shown in Tables A-2 and A-3. The purpose of revising the table format was to permit inspection of the model year vehicle breakdowns for vehicle types 13 and 14, which were not previously available.

#### Using VBD83

VBD83 is on line 14150 of RNMXE9R (the JCL file) as follows:

00014150 VBD83 :0.8800 0.1200

"0.8800" is the VBD83 value which applies to vehicle type 13, while the "0.1200" applies to vehicle type 14. The sum of these two VBD83 values must equal "1.0000".

Change of these VBD83 values is performed at sequence 3 or 8 (i.e., "S3" or "S8") of a '\$RNMSUF terminal session simply by applying the TSO change command to line 14150:

e.g., C 14150 /0.8800 0.12/0.9300 0.07/CR

will result in

00014150 VBD83 :0.9300 0.0700

```

APPENDIX B

Modifications of the General Adverse Response Model  
to Incorporate Sound Level Changes with Vehicle Age

The degradation model (DEGFAC) that was written by Wyle Laboratories is part of the VARNET8Q version of the NRTNEM. Since VARNET9R is the updated version of the model, it was necessary to either include the degradation features into VARNET9R or modify DEGFAC to include the new features of VARNET9R. After comparing the two files it was decided to incorporate the necessary changes into DEGFAC. The modifications that were made appear in Figure B-1.

In addition to these modifications, the DEGFAC file that was stored in TRAWO did not contain several lines dealing with the PERDEG variable, which is used to determine the percent of vehicles exhibiting sound level degradation for all vehicle types which are affected by this change in noise level with age. Therefore, five lines that are included in DEGFAC had to be reinserted in TRAWO(DEGFAC). The resulting file is stored in TRAWO as DEGFAC1. Figure B-2 presents a listing of DEGFAC1.

In order to use DEGFAC1, the user must change line 00010600 of CN.EPADYN.S2KC.\$RNMSUF.CLIST to:

00010600 C 9975 '#MAINP' 'DEGFAC1'

VARNET9R is still a member of TRAWO and BUILD, so if degradation features are not desired, it may be used by changing DEGFAC1 back to VARNET9R in this line. At the end of the session, however, DEGFAC1 should be reentered in line 00010600.

Unless Otherwise Noted, All Lines Above Were Inserted

## APPENDIX B

### Modification of The "National Roadway Traffic Noise Exposure Model" To Incorporate Sound Level Changes With Vehicle Age

DEGFAC1 is a modified version of VARNET9R. It is identical to DEGFAC except for modifications to incorporate the new features of VARNET9R. DEGFAC1 presently contains the IDEGFC, DEGFAC, and PERDEG values, so it is not necessary for the user to input them for each run unless changes in these values are desired.

A copy of DEGFAC1 is presented on Figure B-2.

#### New Variables Introduced Into the Model by DEGFAC1

##### • IDEGFC(I)

"IDEGFC(I)" is either 1 (one) or 0 (zero) depending upon whether sound level degradation will be a factor for the particular vehicle under consideration. For the case at hand, degradation is to be considered for only medium duty trucks ( $I = 8$ ) and heavy duty trucks ( $I = 9$ ); therefore,  $IDEGFC(8) = 1$  and  $IDEGFC(9) = 1$ .  $IDEGFC(I) = 0$  for all the other vehicle types, i.e., for  $I = 1$  through 7, and  $I = 10$  through 14. The user is required to define and input all 14 IDEGFC values.

##### • NI

"NI" is an index of vehicle type, as is "I," however, where "I" takes on values from 1 (one) through 14, inclusive, NI takes on only as many values as there are vehicle types for which degradation is being considered. Consequently, the DEGFAC1 will define  $NI = 1$  when  $I = 8$ , and  $NI = 2$  when  $I = 9$ . NI is internally generated, and therefore does not require user attention.

##### • DEGFAC (IAGE,L,M,LEVEL,NI)

DEGFAC (IAGE,L,M,LEVEL,NI) (hereinafter termed DEGFAC value) is the difference between the actual sound level of the vehicle and the maximum

permissible sound level specified in the noise emission regulation (ALREG). In short, a DEGFAC value is the sound level degradation value.

DEGFAC values are expressed in decibels and are positive, negative, or zero, depending upon whether the vehicle has a sound level respectively greater than, less than, or equal to the ALREG for that vehicle. Twenty-six DEGFAC values are requisite user inputs for each combination of the 5 L's (speed ranges), 4 M's (operation modes), 5 LEVEL's (noise regulations under which the vehicle was manufactured), and (for this case) 2 NI's (vehicle types). This gives one DEGFAC value for each year the vehicle operates, with 26 years being the maximum lifetime of any vehicle considered by the Model. Thus, the DEGFAC array, in this case, is a 26\*5\*4\*5\*2 matrix giving a 5200 element array. The user is required to define and input all of this case's 5200 DEGFAC values.

o EDEGFC (IAGE, L, M, LEVEL, NI)

EDEGFC (IAGE, L, M, LEVEL, NI) is sound degradation expressed in terms of sound energy as opposed to DEGFAC (IAGE, L, M, LEVEL, NI) which is expressed in terms of sound level. Each EDEGFC value is defined by a DEGFAC value where

$$\text{EDEGFC} = 10^{\frac{\text{DEGFAC}}{10}}$$

5200 EDEGFC values, one for each DEGFAC value considered by the case at-hand, will be computed within the program. The EDEGFC array is internally generated, and therefore does not require user attention.

o PERDEG (IAGE)

"PERDEG" represents the percentage of vehicles exhibiting a specific sound level degradation. It is assumed the same for all vehicle types with degradation. This percentage depends upon the age of the vehicles under consideration; thus, PERDEG is an array of 26 elements, one element for each of the 26 years of age permitted by the Model. The user is required to define and input all of the 26 PERDEG values.

the need to renumber lines. Fifty-seven lines of DEGFAC values may be keyed into sequence number 16643 through 16699, inclusive. If additional space for DEGFAC values is still needed, the following sequence ranges may be used to obtain another 118 lines:

16781 through 16799 inclusive, and

16841 through 16939, inclusive.

• 25972

This statement converts DEGFAC values from their representation as a decibel difference (DEGFAC) to a sound factor (EDEGFC).

• 45115

This statement causes operation to transfer to the sound level summation process appropriate to the particular vehicle type. Those vehicle types for which IDEGFC = 0 have their sound energy calculated in sequence number 45300 which utilizes VML. VML is a vehicle population tally. This tally is taken without regard to vehicle age; thus, the tally may include vehicles of various ages. Vehicle types having IDEGFC = 0 have sound levels which do not vary with age; therefore their sound energy summation is performed using VML.

Those vehicle types for which DEGFAC values are a consideration (i.e., I = 8 & 9 for the case at hand) have their sound energy calculated in sequence numbers 45652 through 45656 which utilizes VPOP. VPOP is a population tally of vehicles of a single distinct age. Vehicle types having IDEGFC = 1 have sound levels which do vary with age; therefore their sound energy summation is performed using VPOP.

#### Verification of DEGFAC1 Logic

Verification of DEGFAC1 was performed by comparing the output of VARNET9R using the baseline regulation instruction file (RIFBL) with the DEGFAC1 output that used the same regulations.

Since the degradation features are not used when only baseline regulations are specified, the two runs should have identical noise impact values, which they do. Other comparison runs were also made for VARNET9R and DEGFAC1 using identical input values. Figure B-3 is a printout of noise impact for a DEGFAC1 run. For comparison, a similar printout is given in Figure B-4 for a run using VARNET9R as the main file with identical inputs (see Appendix G of the User's Manual).

This modification of VARNET9R is saved under file-name CN.EPADYN.

## APPENDIX C

### Source Code Listings of NRTNEM Version 9R

This appendix contains the listings of the FORTRAN source code. For each module, the cross-reference listing is given first, followed by the edited source listing as produced by the IBM FORTRAN H Extended Compiler, except for BLOCK DATA modules where the standard source listing precedes the cross-reference. The listings are not identified by section, figure, or table numbers, but the modules appear in the manual's table of contents with the appropriate page numbers. The modules are named by their member name in TRAW0 which is unique. The FORTRAN global symbol names are not always unique since GAR and SEM modules often use the same globals, but are derived from different source modules. The sequence of modules is the same as shown in Figure 3-1.

## / STRUCTURED SOURCE LISTING /

```

C MAIN
C THIS IS A PROGRAM WHICH CALCULATES THE NUMBER OF PEOPLE
C IMPACTED BY NOISE ORIGINATING FROM HIGHWAY TRAFFIC.
C
C DESCRIPTION: THIS IS FILE VARNET4
C VARNET4 LAST UPDATED 11/13/78 16106116
C BIG001 LAST UPDATED 10/31/78 22126123
C BIG002 LAST UPDATED 10/10/78 17136126
C BIG003 LAST UPDATED 11/07/78 17439127
C BIG004 LAST UPDATED 11/01/78 14113145
C FEATURES: HAS VARNET4. CORRECTION EVERY YEAR (WITHOUT LINE 32270)
C RETAINED MOST NOTAN7 CHARACTERISTICS
C SOME FEATURES OF NOTAVOB ADDED; E.G. ELREG
C LWP DERIVED FROM EXPOSURE IN DB BANDS
C CHANGE IN LOCAL CRITERION PERMITTED (I.E. ALC(J))
C VARIABLE NET: READS IN A NET OF YEARS
C NEW SUBROUTINES, CONSOLIDATED COMMON AREAS
C E.G. BACRHO, VEMP0P
C NON-REF SUBROUTINES DELETED: MRF, MWAS, CON
C EXTENSIVE REFORMATTING OF TEXT
C CONSOLIDATION OF BACG0 INTO VEMP0P
C DELETION OF VARIABLE GAM
C MIXED ARRAY FIXED... HAD UNDEFINED NUMBERS FOR LOW IDU.
C RESTRUCTURING OF LOWEST LEVEL IMPACT: NOW COMPUTED IN
C PRIMARY, ADDITIONAL AND DECREMENTAL SECONDARY EXPO-
C SURE. OLD ARRAYS REMOVED.
C DU LOOPS WITH SAME END POINT GIVEN SEPARATE ONES
C TESTS FOR ILLEGAL SITUATIONS
C FULL CONTROL FOR DUMP AND PRINT
C REGULATION SCENARIO IS NOW ITS OWN SEPARATE FILE
C ARRAY IS SPLIT INTO TWO SEPARATE ONES
C SELECTED ZEROING OF ALEVEL(K,L) TO ISOLATE EFFECT OF
C ROADWAY TYPES
C IF ALEVEL=0, PUT EVERYBODY INTO LOWEST DB BAND
C TEN PRINT SUBROUTINES
